Note: Test results may be influenced by the host machine's hardware capabilities. Systems with limited CPU or memory resources may not sustain the throughput required for high-bandwidth tests, particularly UDP, potentially yielding results that underrepresent actual network capacity.

DATA PATTERN REFERENCE

Random payload per RFC 2544 Section 9 and ITU-T O.150. Pseudo-random bit sequences (PRBS) prevent payload compression on the wire and provide realistic traffic simulation. This is the recommended pattern for general throughput benchmarking.
